

10.0 ELEMENTARY PROTECTIONS

DD0015-CV bush covers guarantee protection against corrosion on elementary anchorages, both on temporary and on permanent anchors. DD0015-CV are particularly effective on applications with temporary anchors in several and subjected to several tensioning phases, as they protect: bush, wedge and strand against corrosion, making retensioning easier.

They are also convenient on applications with anchors, as their use avoids the total filling of the long cap with grease, which is expensive and difficult to handle on site. DD0015-CV protections are easy to install, they require the protection of the anchoring element with a layer of grease and are simply inserted over elementary anchorages.

*The protection given by **DD0015-CV** elementary protections is installed on anchorages by covering them with grease and recovering the polyvinyl chloride removed from strands for tensioning.*

*The use of elementary protections avoids filling the cap with grease or anti-corrosion material which is difficult to handle on site, protecting anchorages by means of a series of barriers: grease, polyethylene and caps. **DD0015-CV** bush covers can be temporary. They can easily be removed for retensioning and then reinstalled after the operation is complete.*
